Factor Pack v2.5.4 · USEEIO Supply Chain v1.3 (USD 2022) · EPA Hub 2025 · eGRID 2022 · EPA WARM v16 · EIA CBECS 2018

§ 0 EDITOR'S NOTE ON THE FY 2025 INVENTORY

auditor brief

This report documents a footprint of **16,939.5 tCO₂e** across the FY 2025 reporting period, decomposed and cited line by line in the pages that follow. Scope 1 (direct combustion) accounts for **69%** of the total, driven principally by Gasoline at **11,300.4 tCO₂e**. Of **3,265** classified rows, **0%** used activity-based factors ($\pm 5\text{--}10\%$ accuracy) and the balance used spend-based factors ($\pm 25\text{--}40\%$ per GHG Protocol §7.3.2); emissions-weighted, **85%** of the total came from high-confidence vendor or category matches. The pages that follow carry the full factor provenance, the transaction-level ledger, and the methodology required for assurance review.

§ 0.1 EMISSIONS BALANCE · FISCAL YEAR SUMMARY

kg CO₂e

S1	Scope 1 STATIONARY + MOBILE COMBUSTION, OWNED & CONTROLLED SOURCES	11,743.05	69%
S2	Scope 2 PURCHASED GRID ELECTRICITY, LOCATION-BASED FACTOR APPLIED	3,915.85	23%
S3	Scope 3 VALUE CHAIN · CLOUD · FREIGHT · TRAVEL · PURCHASED GOODS	1,280.62	8%

CLOSING BALANCE · FY TCO₂E

16,939.5 tCO₂e

§ 1.1 SCOPE 1 · DIRECT COMBUSTION

§ 2 METHODOLOGY & STANDARDS

per GHG Protocol

This inventory is compiled under the GHG Protocol Corporate Accounting and Reporting Standard (Revised Edition) and the Corporate Value Chain (Scope 3) Standard. The hybrid methodology follows the §7.3.2 data hierarchy: Tier 2 activity-based factors where customer activity data was supplied; Tier 3 spend-based screening for the remainder.

Spend-based factors are drawn from EPA USEEIO v2.2 at 2022 producer prices, with commodity codes mapped to NAICS 6-digit. Factor file version: **2.5.4-audit-complete**. These factors carry an industry-standard $\pm 25\text{--}40\%$ uncertainty band per GHG Protocol Scope 3 §7.3.2. Activity-based factors use EPA Emission Factors Hub Table C-1 for liquid fuels, EPA Stationary Combustion factors for natural gas and propane, eGRID 2022 grid intensity for electricity, and IPCC AR5 100-year GWP for refrigerant fugitive emissions. Activity factor file version: **1.0-activity-2026-04-15**. Activity-based accuracy: $\pm 5\text{--}10\%$.

For this report, **0** of **3265** classified rows (**0%**) used activity factors; **3265** used spend-based factors. Activity rows take precedence over spend rows for the same emission category — no double-counting.

Scope 1 captures direct emissions from owned or controlled sources; activity data supplants spend where supplied, else the spend-proxy method applies and is disclosed as such. Scope 2 captures purchased electricity. Grid factor applied for Scope 2: **1.43** kg CO₂e per USD (US — California). Activity-based electricity uses eGRID 2022 subregion **CAMX**.

Cat 12 (End-of-Life). GHG Protocol Scope 3 Category 12 (end-of-life treatment of sold products) is **not applicable** to this report. The customer does not sell physical products, so there are no end-of-life emissions to attribute. A SaaS, service, or professional-services business legitimately reports Cat 12 as N/A under GHG Protocol Scope 3 Standard §5.12.

Scope 3 category coverage. Of the 15 GHG Protocol Scope 3 categories, this report renders results for **Cats 1, 3, 4, 6, 7, 12** — purchased goods and services (spend-based screening per §7.3.2), fuel- and energy-related activities (Activity C — grid T&D losses derived from Scope 2), upstream transportation (when freight spend is present), business travel and employee commuting (when the relevant spend is present), and end-of-life of sold products (Cat 12 where applicable; see §4b above for the three-branch disclosure). Each of these categories renders only when the classifier detects matching activity in the uploaded data — a report covering purely office-based SMB spend will typically render Cats 1, 3, and 12, while Cats 4, 6, 7 appear only when freight, travel, or commute categories are populated. Factor data is additionally provisioned for **Cats 2, 5, 8, 9** (capital goods, waste, upstream leased assets via EIA CBECS average-data intensity, downstream transportation via EPA Hub distance-based factors) — engine routing of customer inputs to these categories is scheduled for the next release; rows exist in the factor file and are citable, but do not yet

materialize in the report. Categories 10, 11, 13, 14, 15 (processing of sold products, use-phase of sold products, downstream leased assets, franchises, and investments) are not covered in this release and are disclosed as out-of-scope per GHG Protocol §5. A customer for whom any of these uncovered categories is material should supplement this screening with a category-specific inventory before using the numbers for regulatory filing or third-party assurance.

Price-level adjustment. USEEIO Supply Chain GHG Emission Factors v1.3 (used for spend-based rows in this report) are published in 2022 producer-price dollars. This release treats spend at its nominal USD value; an inflation-bridge using the BEA GDP implicit price deflator (NIPA Table 1.1.9, 2017 = 100) is available in the engine but not yet auto-applied, pending a separate reviewer pass on the customer-number shift. Customers reporting against a base year materially different from 2022 (older historical filings, or forward-looking projections beyond 2025) should request the inflation-adjusted variant — the engine function `calculate_inflation_bridge` is callable and yields a factor-per-target-year-USD with the BEA deflator ratio shown explicitly.

Multiple currencies were detected (CAD, EUR, GBP, INR, USD). Non-USD amounts were converted to USD using static FX rates (vintage: February 2026) before emission factors were applied. Conversion details appear in the Transaction Ledger.

Calculation. For spend-based rows: $\text{tCO}_2\text{e} = (\text{spend USD}) \times (\text{factor kg/USD}) \div 1,000$.
 For activity-based rows: $\text{tCO}_2\text{e} = (\text{physical quantity}) \times (\text{per-unit factor}) \div 1,000$.
 Refrigerant fugitive emissions: $\text{tCO}_2\text{e} = (\text{refrigerant kg}) \times (\text{GWP100}) \div 1,000$.

Classification uses Claude AI (claude-sonnet-4-20250514) with a deterministic keyword fallback per EEIO commodity-code mappings. Vendor name takes precedence over expense_category when both are present. This report was generated on 24 April 2026.

Sensitivity. Spend-based accounting carries an industry-standard $\pm 25\text{--}40\%$ uncertainty. Applied to the inventory total (16,939.5 tCO₂e), the plausible range is 10,163.7–23,715.3 tCO₂e at the conservative $\pm 40\%$ envelope. Substituting activity data for spend in high-impact categories tightens this band toward $\pm 5\text{--}10\%$.

This draft is intended for screening, supplier-disclosure response (CDP, Walmart Project Gigaton, Microsoft Supplier Sustainability), and management decision support. For formal regulatory filings or third-party assurance, supplement with primary activity data across material categories and engage an ISO 14064-3 reviewer.

§ 2.1 SCOPE BOUNDARY STATEMENT

This inventory declares **Scope 1** (direct fuel combustion), **Scope 2** (purchased electricity), and **Scope 3** (value chain) emissions. Scope 3 categories included: cloud computing / hosting, courier & delivery. Scope 3 categories not assessed from spend data: business travel, employee commuting, purchased goods beyond IT & courier, capital goods, waste disposal, and other upstream/downstream categories

not identifiable from spend. Of 3,500 line items, 3,265 were classified into Scope 1, 2 or 3; 235 were excluded as non-emission or unrecognized categories. **Credits & refunds.** 105 negative-amount rows (credit memos, returns, billing adjustments) were netted against purchases in the same emission category before applying factors, per GHG Protocol §7.3.2 (economic-value method) and consistent with GAAP/IFRS return accounting.

§ 2.2 DATA INTAKE DECISIONS · STRUCTURAL

auto-detected

Before parsing the upload, the engine inspected its structure and auto-detected the settings below. Each decision normalizes the data to a consistent internal format before emission factors are applied, preserving the ability to reconcile each line against your general ledger.

File encoding	UTF-8
Decimal convention	US (1,234.56)
Negative amount format	Hyphen (-1234.56)
Date convention	YYYY-MM-DD (ISO)

Additional notes. Detected date format: YYYY-MM-DD (based on 439 date cells with majority-vote convention)

§ 2.3 ROW-LEVEL INFERENCE DECISIONS · TOP 20 BY SPEND

rescued rows

§ 3 DATA QUALITY · CONFIDENCE & PROVENANCE

rows classified

85% of total emissions came from rows classified at high confidence (vendor or category matched at ≥ 0.8). The balance sits in medium- or low-confidence rows — review those in the Transaction Ledger if citing specific line items. Top 3 vendors represent 98% of Scope 1 spend (4 distinct vendors total) — reduction effort concentrated on those three accounts has the highest leverage.

The engine recovered 830 data points that would otherwise have been excluded or left blank: 79 via notes-column inference, 396 via region / notes currency detection, 355 via adjacent-row date estimation. Each recovered row is flagged in the Transaction Ledger with its inference source.

Classification method	GHG Protocol spend-based (automated)
Emission-factor source	EPA USEEIO v2.2 supply-chain factors – v2.5.4-audit-complete
High-confidence mappings	2,947
Items for review	553
Total transactions flagged	486
· missing vendor name	381
· negative amounts (credits)	105

Industry-standard estimation per GHG Protocol Corporate Standard (2015 Revised). Spend items were classified via automated mapping with keyword and vendor recognition. For tighter accuracy, supply actual activity data (kWh, litres, km) where available.

§ 4 REGULATORY FRAMEWORK GUIDANCE

disclosure-aligne
d tier

FRAMEWORK	DATA RELEVANCE	COVERAGE	NOTE
SEC Climate Disclosure	Scope 1 & 2 estimates	PARTIAL	Activity data needed for filing
CSRD (EU)	ESRS E1 baseline	PARTIAL	Additional metrics required
CDP Climate	C1–C12 inputs	ESTIMATED	Verify with measured data
GHG Protocol	Spend-based method	ALIGNED	Standard estimation approach

Emissions are estimated using the GHG Protocol Spend-Based Method with EPA EEIO factors. For enhanced precision, supplement with actual activity data (kWh, litres, km). Consult your sustainability advisor before any regulatory submission.
